

MISAPOR

SCHAUMGLASSCHOTTER

“With coresuite mobile, coresystems demonstrate their innovative strength and use of the latest technologies.”

Adrian Rauh, Executive Management Misapor AG.

Misapor AG differentiates itself by providing excellent services with regards to consulting, order processing and logistics. After several years of continual growth, the company found itself confronted with the problem that it had outgrown its IT solution. In order to provide their field and sales force with an instrument for the mobile processing of orders a new ERP system was introduced, and the **coresystems** portal solution was added.

coresystems' primary concern when working with Misapor AG was to establish a materials ordering platform for their field agents. Using this portal they can place material orders and start shipment, similar to how online shops work. As soon as an order has been placed it is entered and processed in the SAP system of Misapor AG.

The new **coresuite mobile** solution perfectly complements this feature and allows staff and managers to access data saved in the SAP system on the go through mobile devices such as an iPhone.

With this new portal solution Misapor AG was able to distinctly reduce the number of interfaces, minimize the need for internal communication and improve data quality. The company management, responsible for six entities with different locations, needs to travel a lot, which makes access to all the latest business information a must. **coresuite mobile** provides up to date availability of all critical performance metrics at all times.

“We’re eager to see which new innovations **coresystems** will come up with in the future.”

Adrian Rauh, Executive Management Misapor AG.

About Misapor AG.

In the early 1980s, Misapor AG developed a new process for manufacturing foam glass. Misapor, the innovative construction material, was first introduced onto the market in 1987. Thanks to continuous positive responses and a rapidly growing demand, even during the early years, the company was able to plan and build a second production facility: since autumn 2002, they not only produce in Surava, but also in Dagmersellen.

In recent years, Misapor sales have increased consistently and substantially, aided by the fact that the light foam glass ballast has also made its mark outside Switzerland. Misapor became a successful export product, and a third production site was set up near Cologne, Germany. Their sales team works closely with their customers through multiple branch offices.
