To-Increase goes mobile on cloud

2 March 2011

To-Increase has partnered with Swiss-based Coresystems to deliver a new cloud-based mobility solution for Microsoft Dynamics AX and NAV.

The integrated solution enables management, sales and service personnel in mid to large size companies to use mobile devices to access business information at any time, from any location.

The new solution will be available for preview in June 2011 and released in November 2011 on the new Microsoft Dynamics AX 2012 version and on the Microsoft Dynamics NAV 2009 R2 version.

“Our mobility vision for mid to large size companies is to provide end-to-end integrated solutions that help companies run worldwide management, sales, and service processes that involve mobile front-office workers and HQ-based back-office workers,” said Cornelis Bosch, CEO, To-Increase.

“
The solution helps us bring together advanced mobile functionality with solid enterprise application business process support, so that companies can focus on delivering and supporting great products

”

The integration between To-Increase business integration solutions and Coresystem, Coresuite mobile, provides management and mobile workers with real-time, bi-directional access to business information in the enterprise application. Integration points include customer and vendor, activities, orders and service calls.

Bosch said: “This integration provides instant access to information and easy exchange regardless of time or location. The solution helps us bring together advanced mobile functionality with solid enterprise application business process support, so that companies can focus on delivering and supporting great products and services.”

Integration capabilities support bi-directional data exchange by utilising the connectivity, workflow and change log features of the business integration solutions so that sales and service departments work in concert and as teams, rather than in separate environments. This can help decrease errors and redundant work, and improve flexibility and quality control in order to help companies speed performance and keep costs down.

“We have established a strong collaboration with To-Increase to accelerate product innovation that benefits Microsoft Dynamics customers,” said Manuel Grenacher, CEO, Coresystems. “To-Increase has an extremely flexible integration platform for connecting Microsoft Dynamics solutions with our Coresuite cloud, making it easy to add functionality for mobile applications on Windows Phone 7, iPad, iPhone and more.”
